7705 sar-8 manual

The platform delivers strong convergence capabilities in the mobile RAN with native service processing of 2G, 3G and 4G traffic. In addition, the platform can provide a powerful solution for wire line aggre gation and routing in carrier and enterprise applications. The AlcatelLucent 7705 SAR owes much of its development heritage to the AlcatelLucent Service Router SR product line. Sharing much of the marketleading feature set of that product, the AlcatelLucent 7705 SAR brings a powerful, serviceoriented capability to the RAN, but in a form factor and at a price point that are particularly appropriate for cell sites and hub locations. The platform can be option ally configured with a redundant core control module and uplinks. The AlcatelLucent 7705 SAR8 has eight slots; two are allocated for control and switch modules CSMs, with the remaining six being available for user traffic adapter cards. The Alcatel Lucent 7705 SAR has a compact modular architecture, constructed to allow flexible use of line adapter cards so operators can optimize the configura tion to meet the specific requirements of a site. With the modular architecture comes additional resilience and flexibility.S E R V I C E A G G R E G A T I O. With endtoend service management under the AlcatelLucent 5620 management The platform can be optionally configured with a redundant core control module and uplinks. The AlcatelLucent 7705 SAR has a compact modular architecture, constructed to allow flexible use of line adapter cards so operators can optimize the configuration to meet the specific requirements of a site. The use of pseudowires ensures that the key attributes of the service are maintained, while using a costeffective packet environment to aggregate services. The use of circuit emulation service CES ensures that only the active timeslots are transported, keeping bandwidth usage to a minimum.The AlcatelLucent 7705 SAR supports N1 cell mode for transport of ATMbased services. Multiple access ATM ports are bundled together to attain higher speeds using IMA. To offer greater scalability, all the traffic out of an Ethernet port can be carried over a single Ethernet pseudowire or, alternatively, a pseudowire can be created for each VLAN that is assigned to a different service or endcustomer. When dynamic signaling is deployed, the endtoend pseudowire is established using targeted label distribution protocol TLDP and the MPLS tunnel via LDP. In addition to efficient LDPbased dynamic signaling, static provisioning of both the MPLS tunnel and the pseudowire is also supported. Not all types of traffic have the same set of requirements. Traffic classification and marking is carried out based on the following. With interfaces supporting a wide range of access. SARM, AlcatelLucent alcatel lucent 7705 sar m manual Canada Inc.
