More About this Item Continuously monitor the integrity of one operator and the discharge path to ground of one ESD protective work surface. Monitor eliminates the need for periodic testing and record keeping, providing instantaneous notification of static control equipment failure. Realtime monitor ensures that critical ESD generators in static sensitive areas are effectively grounded; unit independently monitors both the work surface and the operator. Process monitoring measurements shall be conducted in accordance with a Compliance Verification Plan that identifies the technical requirements to be verified, the measurement limits and the frequency at which those verifications shall occur. The Compliance Verification Plan shall document the test methods and equipment used for process monitoring and measurements. If the test methods used by the Organization differ from any of the standards referenced in the document, then there must be a tailoring statement that is documented as part of the ESD Control Program Plan. Compliance verification records shall be established and maintained to provide evidence of conformity to the technical requirements. Description The Desco Analog Surface Resistance Test Kit is a portable battery powered instrument designed to measure resistance point to point RTT and surface to ground RTG. The meter is equipped with an automatic test voltage selector. The test voltage will switch from to 100V should the measured resistance exceed 10E5 ohms. Press and hold the TEST button until the measurement is displayed see Figure 3. 6. Perform additional measurements by placing the electrode on the most commonly used or worn areas. CAUTION If there is a current limiting resistor in the worksurface and the worksurface resistance is lower, the measurement will primarily be the resistance of the resistor. It is recommended to measure RTT particularly if the material color is black. Press and hold the TEST button until the measurement is

displayed see Figure 4. <http://www.varanini.pl/userfiles/3m-mp7640-manual.xml>

NOTE The test kit can be used to measure RTG and RTT of shelves, garments, floor and cart worksurfaces using test procedures similar to worksurfaces and foot grounders. MEASURE WORKSURFACE RESISTANCE TO GROUND RTG 1. Do not clean the surface. 2. Remove all ESD sensitive items from the surface and items that might interfere with the test. 3. Connect one lead banana plug to ground. NOTE Use an ESD cleaner containing no insulative silicone i.e. Desco 10435 Reztore™ Antistatic Surface and Mat Cleaner. The sleeve to sleeve resistance test should be made to ensure proper resistance range through the entire garment. The frequency of cleaning will depend on usage; once a month would be a good starting point. The Analog Surface Resistance Meter requires little maintenance, and there are no user serviceable parts. If your unit requires service beyond cleaning the electrodes or replacing the batteries, please contact Desco Customer Service. In others, a static charge generation test may be required. The frequency of testing is also a consideration. Full brightness of the continuity LED occurs when the resistance between prods is 300K ohms or less. Reversing prods. The master and remote units separate for endtoend testing of installed cabling. Your work as an expert requires safe testing. Therefore, you should not make any compromises concerning safety.
