The detailing shown will be suitable in principle for fabrication and erection in many countries, and the sizes shown will act as a guide to preliminary design. The second edition has been updated to take account of changes to standards, including the revisions to BS5950 and includes a new chapter on computer aided detailing.

Haywards primary field of research was fluid density and flowmeters, writing a textbook on the subject, and presenting to the Institute of Physics in 1981. Frank Weare MSc, DIC, DMA, CEng, FStructE, MICE, MIHT, MBIM, formerly at the University of Westminster, is currently an independent consultant to various civil and structural engineering projects. Anthony Oakhill CEng, MICE has over 35 years experience in the design and construction of steel bridges and structures. He currently works for Gifford and Partners, consulting engineers, Southampton. Its purpose now, as then, is to provide an introduction and guide to those in the constructional steelwork industry who are likely to be involved with the principles concerning the detailing of structural steel. The third edition of this important detailing manual recognises the principal changes which have occurred over this period of time. There continues to be a marked improvement in steels market share for buildings and bridges, both here in the UK and in many overseas countries. Design and construction engineers, and architects, have continued to develop their appreciation for the often striking and aweinspiring structures that have been designed and built in steel. But for the general public, who first see and marvel at these buildings and bridges, the creation, planning and development of any new steel structure is largely an unknown story. The many hours of work required to transform a sketch, resulting from a brainstorming meeting, into shaped pieces of elegant steelwork, are for the most part not well understood or even appreciated by the public at large. But also what is less well understood is that the nature of steel construction has markedly changed. During that period, the mix has moved from being predominantly industrial to being predominantly commercial.

Steelwork has most convincingly established itself as the modern day material, being without equal for the many highly visible prestigious and stimulating structures which adorn our landscape throughout the country. It is often said that simple sketches and drawings can often account for a multitude of words and, of course, it is the production of those drawings, the detailing of the steelwork structure that provides the unbroken link between the designer and the constructor. One of the most important functions of the detailed drawing is to demonstrate the anticipated costs of the proposed steelwork structure. The costs of steelwork are not just confined to the raw materials and the production of the basic steel sections, but are determined more importantly by the connection details. Steelwork contractors will often confirm that their businesses depend on economic detailing. It is here then that one of the most important roles in steelwork production rests in the control of the steelwork detailer or CAD technician. Steelwork designers have had to come to terms with the advent and increasing use of European design and construction standards. The manual attempts to clarify the present situation. It is however recognised that this is a constantly changing target, and the reader is advised to consult British Standards and other recognised professional steelwork organisations to determine the latest information. For the steelwork detailer perhaps the most important development in recent times has been the rise of 3D modelling techniques, the increased use of drawing layers, and the ability to speedily transmit drawings electronically between offices, works and sites. By these methods, it means that all parties to a project can inspect and comment on the developing details with a minimum of delay, which helps with keeping costs in check.

This is of importance to the early stage stakeholders in a project, who look to the functionality provided by the enhanced 3D models to develop value engineered solutions. With increasing overseas supply and challenges as regards compliance of construction products, it is important that steel detailers are informed and exercise duty of care in ensuring clear documentation is produced. Most significantly, access to the full industry foundation class IFC based model of the building is included, allowing users to import this IFC model into their own software and further explore the details. Included with the model are numerous examples of typical deliverables, including marking plans, assembly DWGs, fitting sheets, material takeoff and bolt lists. It is now hardbound rather than the previous folder structure, and the printed drawings in the previous version have been replaced by the digital IFC model and deliverables. They are accessed via an eReader when online. It is not possible to download or print them.

Whereas the Structural Steel Connection Series released in 2007 simple connections for open sections, 2009 rigid connections for open sections and 2013 tubular connections aims at practising structural engineers, this publication has been revised and refreshed to provide a concise reference to good practice and standardisation in connection configuration, applicable to a number of other stakeholders such as steel detailers, engineering students and suppliers of components associated with steel connections. This is available from the ASI Bookshop in hardcopy and eBook format at. Each vehicle will have its own set of problems to deal with. Even so, this detailing manual is intended for use as a guide to show you the steps involved in automobile detailing. It can also be used for reference because it will tell you which products will effectively and efficiently perform each step in the auto detailing process and, in turn, teach you to achieve that professional look with every job.
