In the long run, you will get more from your saw because it allows you make several different straight or diagonal cuts in wood with the tool you may not be able to make without it. It also provides a straight edge for measurements and other practical uses. I purchased this tool with my Dremel SawMax specifically so I could make flush bevel cuts in wood with the tool, which this will do. It is made of a solid reinforced plastic that can handle rough treatment and much larger than I thought it would be. It comes with its own manual so you can use it to its full potential. A quality product. My intention was to cut base moulding; but, after one cut, I knew this wasn't the right tool for the job. Being its made of plastic, one miss cut and the plastic is gouged. The saw its used with is great for small jobs. However, this tool just didnt work for me. A waste of money and time. After using the saw a few times and seeing the power and ease of use I ordered a few accessories. This one allows simple and quick miter cuts and acts as a saw guide for making short straight cuts. To get the full use. Just what I needed. And thanks for all the reviews that pointed out it was easy to nick the face when cutting. Brilliant! Now I wont nick the plastic face. The plastic of this tool is not thin plastic. It is a cast, strong, durable plastic that is quite rigid. I'd almost consider this disposable, but for the minimal price and if you get the end result you're looking for, who cares! It did the job, but in the process I cut the guide itself. Still cheaper than handyman and more versatile than having a proper miter saw for oneoff work. Otherwise its better to find a friend with a saw. Or you can get this one, it worked great with my Dremel MaxSaw. I was very disappointed. Its not included with this

guide nor the Sawmax. Its a handy blade to get, so I dont begrudge that purchase, but Dremel does an awful job of communicating that information on their product pages, packaging, and documentation. [http://www.martinsnegocios.com.br/zeturin/www/admin/mod\\_galeria\\_eventos/arquivos/counterinsurgency-petraeus-manual.xml](http://www.martinsnegocios.com.br/zeturin/www/admin/mod_galeria_eventos/arquivos/counterinsurgency-petraeus-manual.xml)

Good The guide itself is plastic. Its quite sturdy and doesnt flex without a significant amount of force. You can set aside your concerns about flimsy plastic equipment Dremel built it well enough that it is perfectly adequate for this kind of task. Great idea and it works exceptionally well. I didnt make any errors or have to recheck my work multiple times before cutting something I always have to do when using a miter box. Good The guide gives you the ability to cut baseboards at 45 degrees and make straight cuts through flat wood at 45 or 90 degrees. Cool. Bad You hold the Sawmax at a 45 degree angle when making a miter cut, which means the Sawmax has to float over a big part of the guide. This makes it challenging to clamp down the guide and workpiece if youd intended to good thing you dont have to. Bad The guide works well for outside corners, since you hold the guide right up against the flat backside of your moulding. But inside corners are difficult, and the left inside corner is almost impossible. That makes a lot of sense when youre putting up rectangular casing, but when youve got baseboard with a design, its not flat. For right corners, I was able to use a second moulding cutoff as a spacer so that the back end of the guide stood off the bench the same distance as the front. For left corners. Good luck if the top thickness of your moulding is significantly thinner than the base. In this configuration the guide must be held against the thin top face of the moulding, but because the rear end is held off the ground, the guide never makes contact with the top. This is obviously an unsafe and errorprone solution. I wish there was an official one. Bad The track you move the Sawmax along in order to make a miter cut is surprisingly difficult to line up with. On nearly every cut I had my Sawmax lined up, moved it back and forth a few times to be confident I was in the zone, then started my cut.

And within a couple of seconds the saw had finally settled into a more stable placement. Obviously I was setting up the saw incorrectly and the vibration wiggled it into place, but its really not easy to know you got it right the saw is black and the guide is black. Is the black plastic flush with the other black plastic. Its sure hard to tell visually, and apparently difficult to get it right by feel, too. Whats left Smell So far it stinks. Bad Because theres some wiggle room in the track, the Sawmax often chews little pieces out of the guide. It cannot survive many cuts before being so chewed up its useless. Bad The saw blade doesnt clear the moulding. It nearly cuts through, but never all the way. Ive had to finish and clean up every Sawmax cut with a handsaw. Bad I couldnt find a good way of measuring how long my cut would be. Back to the old method of creeping up at the right length by many successive cuts. Bad Due to the flush cut blade, when you make a straight cut, the Sawmax drops away from the guide because theres no overlap with the workpiece you cut it off flush!. I had no issues but this felt extremely dangerous every time it happened. If I was clumsier or smarter I would not be comfortable using this at all. This isnt a badly built product, but its really poorly designed. It looks good and hits all the right sales notes, but it just doesnt work well. Bottom line, avoid this and go buy yourself a simple miter box and a handsaw, or spend the big money and get a power miter saw. Im going to finish my baseboards tonight and then this thing will go in the garbage. Yes 0 No 0 Report Average Rating 5.0 out of 5 stars Handy little cutter November 5, 2013 Bought it to avoid using a full sized circular saw to do plunge cuts to remove damaged sections from a wooden security cabinet. Easy handling, easy blade replacement, easy depth adjustment. I frequently need to cut out an inspection hole in ceilings for maintenance personnel to check the plumbing when a leak occurs. I've tried other saws but they were too hard to maneuver and made too much mess.

The smaller blade on this one makes less mess but really cuts quickly and efficiently and is easy to maneuver with the convenient finger squeeze trigger and easily operated trigger lock release. This is actually my first ever Dremel tool and I'm really impressed with its power and ease of operation. I think it really meets up to the Dremel reputation for quality and versatility. I plan to purchase the accessory that is used for making accurate miter cuts in trim wood and also the flush cutting wheel. Very inexpensive additions that give the saw even more versatility. I'm certainly happy with my Saw Max saw and feel it will serve me for many years. See more Reviewed by TimB TimB Written by a dremel.com customer. After attempting to use a circular saw I decided I needed something a lot lighter and easier to handle and decided on the Dremel SM20. I was amazed at how easy it was to guide by hand. Just mark a line and follow it. I also used it to rip several lengths of 1x4 up to 7 feet long. They almost looked like they were done on a table saw. Definitely a tool that's worth its weight in gold. See more Reviewed by BobB BobB Written by a dremel.com customer. Helpful Yes 3 No 0 Report Average Rating 5.

0 out of 5 stars Excellent tool for specific applications June 24, 2014 Bought the Saw Max SM20 specifically for a laminate flooring job in my home. Excellent for plunge and fussy cuts. I preferred my cabinet saw table saw for dimension cross and rip cuts of planks, but the SM20 would do those as well, just less precise and slower. The dust collection adapter should be packed with the saw. My local stores did not carry it. I also bought a flush cut blade and found that to be superb for casing cuts. Over the decades I have done countless home improvement and construction projects, accumulating many very capable tools along the way. It is not an absolute necessity but it certainly is a perk for better storage and transportation. The SawMax is powered by a 6 amp motor generating approximately 17,000 rpms. Remove the bolt and pressure plate, swap the blade wheel, then replace the plate and tighten the bolt. Overall, the SawMax did a good, if not great job, considering its size and allpurpose nature. When I first saw pictures of the SawMax, my initial impression was that it was too small and not rugged enough to withstand years of construction projects. That said, I have to admit that I was totally wrong. The SawMax is very well constructed and nicely sized, with a good overall design. It is built to get the small to medium cutting jobs done. To give you a bit of background info, I have procrastinated all year on installing a metal roof on our pump house. Since the skies have turned gray and stormy here in Seattle fortunately I picked the one day in the next six months the clouds parted and did not rain, it was past the time to get it done. Typically I use a sawzall and metal cutters to cut metal roofing. But thought this the perfect trial for the SawMax and the included metal cutting blade.

In the video above, not only am I cutting through the metal but a bit of the rock it is sitting on as well nothing like a little operator error to prove a point. A fair trade considering the comparative easy and greater precision the SawMax gives you. There was little kickback or error caused by the torque of the saw's operation. I have other small saws that I constantly have to be aware of them kicking back at me when cutting. While the SawMax did occasionally come back at me, it was rare and controlled. I am very glad it has joined my army of tools;. Even though we may receive compensation, we always give our honest opinions about our experiences with each product. One demo stated to tighten it with the hex wrench but there is no hex fitting to tight. You can get them

other places but shipping will nail you. So if you order multiples of a blade you will get free shipping. WalMart has free shipping to store. How do you prevent the foot from melting when cutting tin? They would eventually start to break out around the edges but I ran them until they appeared to have cracks starting to run towards the center from the area they would chip out at. Three improvements I would make would be to make them with an adjustable variable speed, make the guard and foot out of metal and make toothed blades for them as well. We do a lot of that on Mission work, ripping sheets 10 ft plus long. Will the SawMax handle that work? However, by the time I was done I had pretty well melted the plastic shoe on the backside closest to your hand. Also to help increase blade life I cut as shallow as I could with the blade so as little as absolutely necessary protruded below the tin. I saw a Rockwell equivalent at Menards a while back that is a little bigger but has a metal foot and a much better blade assortment selection. They actually have some fine tooth cutting blades which would probably work better than the Dremel abrasive style cutting disks.

The marginal size difference in size I don't think would be an issue cutting sheets on a table or saw horses, it is still pretty compact. The machine is a waste of plastic parts. These are not for years of construction as you claim. Dewalt do that. These are a joke only good to use once every six months. Trust me I've just gone through 2 in 6 hours. Ohh I must of been doing something wrong to rough, not ready for some real work. Bad design, bad item. I have had this particular tool for several years and use it quite often weekly for cutting everything from tin to wood and it still does a very good job and has not quit me yet. I have never received any type of stipend, kick back or reward for any evaluation or opinion for this tool or anything else I have ever left a comment on. The blades though are horrible. Dremel should research toothed blades that fit their 77mm arbor. By including an adapter, the arbor diameter could adapt to other brands toothed blades. Unless of course unless their strategy is to sell blades like printer ink cartridges at 10x fair value You can also subscribe without commenting.
