We introduce an adaptive optical microscope with a direct wavefront sensing method using a Shack-Hartmann wavefront sensor and fluorescent protein guidestars for live imaging. The results of imaging *Drosophila* embryos demonstrate its ability to correct aberrations and achieve near diffraction limited images of medial sections of large *Drosophila* embryos. GFP-polo labeled centrosomes can be observed clearly after correction but cannot be observed before correction. Four dimensional time lapse images are achieved with the correction of dynamic aberrations. These studies also demonstrate that the GFP-tagged centrosome proteins, Polo and Cnn, serve as excellent biological guidestars for adaptive optics based microscopy.
