It also features Night Display for easy viewing in low light a perfect feature for gathering friends and family around to see your images. Smart AUTO intelligently selects the proper settings Just set the Canon PowerShot SD1200 IS Digital ELPH to Smart AUTO and you're ready for maximum enjoyment from your picture taking every time. It's a relaxing and satisfying way to shoot because you can completely concentrate on your subject knowing that the camera has the technical details covered. Advanced Canon technology intelligently analyzes your situation and shooting conditions. Then it automatically selects an appropriate setting from 18 specially defined settings. So whether you're photographing flowers, a captivating sunset, or your friends at the park, you can be confident that you're getting dramatic, memorable images. Shooting Modes Advanced presets for the best possible photos under certain conditions. With 17 Shooting Modes, you're ready for whatever shot comes your way. A World of Advantages with Canon's Technology The DIGIC 4 Image Processor has evolved Face Detection Technology that tracks the faces of moving subjects and lets the shooter enter the frame seamlessly with the Face Detection SelfTimer. DIGIC 4 Image Processor Canon's most advanced image processor, DIGIC 4, delivers evolved Face Detection Technology that keeps every face in every photo looking its very best. The technology finds and tracks the faces of moving subjects until you're ready to shoot, then delivers perfect focus. In addition, exposure, flash and white balance are compensated, so that faces exhibit natural skin tones and backgrounds are properly exposed. Using an internal database of thousands of different photos, iSAPS works with the advanced DIGIC 4 Image Processor to improve focus speed and accuracy, as well as exposure and white balance. A Face Detection SelfTimer automatically detects an increase in the number of faces and makes the appropriate adjustments.

For instance, to include the photographer's face in a group shot, there's no need to rush in. Just put the camera on a stand or tripod, specify Face Detection SelfTimer, and the camera will wait for the photographer's face to get on camera before it takes the shot. Motion Detection tracks moving subjects in a much larger range allowing you to wait for the perfect shot without refocusing. Intelligent Contrast Correction DIGIC 4 also makes possible the iContrast Intelligent Contrast

Correction system, which controls the compensation level in pixel units to brighten dark areas while leaving bright areas unchanged for better images where the main subject is dark, and more natural transition. The PowerShot SD1200 IS Digital ELPH can even use iContrast in playback mode to adjust images that were shot without the setting activated. Redeye Correction provides three options for removing redeye from subjects in flash pictures. 1 Redeye Correction during shooting actually identifies and corrects redeye in human subjects as pictures are taken. 2 The PowerShot SD1200 IS Digital ELPH can be set to automatically detect and correct redeye during image playback. 3 You can manually locate any red eyes in a scene during image playback on the LCD screen, and command the camera to remove them. Life doesn't give you second chances to capture special times. That's why the PowerShot SD1200 IS Digital ELPH features an ISO 1600 setting that reduces the effects of camera shake and sharpens subjects in lowlight situations, giving you greater shooting flexibility. ISO can be expanded to 3200 when you select ISO 3200 Special Scene mode. Jadee 5.0 out of 5 stars Then it was waterdamaged. I find many products that are new arent as good as what theyve replaced. This is an example.I LOVED that camera. The camera still functions very well and easily fits into pants or jacket pockets. I could turn on my previous camera with one hand to take quick shots.My original camera was same model, except dark gray, purchased 3 years ago. After the theft, I immediately went on Amazon to replace it with the same model. Unfortunately, since this model is 3 years old, I was unable to afford the camera in the dark gray color. The prices for a new camera in that color were twice what I had paid for the original camera. So I compromised and settled for a new blue camera in the same model, which had a reasonable price. The camera is perfect, and works just as well as the original. It is tiny in size, and will fit into my shirt pocket, even inside its little case. It takes great shots, even if I shake the camera a bit. And there is an optical viewfinder, in addition to the digital screen. I cant find anything I DONT like about the camera, except that because of its size, I suppose it is easier to lose or get stolen. I like the camera model so well, that after receiving this camera, I bought another one, same model, except used, and I am also pleased with it. Though the camera does not come with a memory card, they are quite inexpensive now. Love the camera! And also pleased with the supplier!Ive owned many models of Elph, this is my 6th or 7th, so my review is aimed especially at other serial Canon owners. Good news my averagesized male hands can still comfortably hold it, barely not covering lens, flash, or resting on the LCD. Unfortunately, the CameraWindow software has been intentionally dumbeddown in the 6.

x software and no longer offers the options to delete your photos have to go through the OS, nor to chose custom naming for the downloads. I say intentionally, since I asked Canon customersupport about it and they stated the changes were not bugs. SD1200 owners are stuck with 640x480 video. Canon has several subseries within the compact Elph line, varying mostly by asthetics and optics. The SD1200 is successor to the series that included the SD1100, SD1000, and SD600. These all favor a classic, slim design. If youre unfamiliar with Canons Powershot cameras, theres lots of good material out there on camera sites such as dpreview. Thats intrinsic to the size of camera, and vendors try to correct these effects in their onboard processing. My opinion is that Canon does a good job of correcting for these issues and the Elphs including the SD1200 take very good photos for their size. Its questionable that a SD1100 owner would specifically find this a compelling upgrade other than the Digid4, but this is an excellent compact camera in all ways. Apart from the noteworthy quirks the lack of HD and the limited features in the download software, this camera is Highly Recommended.In order to navigate out of this carousel please use your heading shortcut key

Therefore, the operations of the microprocessors used in the machines are not discussed they are explained in terms of from sensors to the input of the DC controller PCB and from the output of the DC controller PCB to the loads. The CPU of the reader unit interprets input signals and the signals from the host machine, and generates signals used to drive such DC loads as motors and solenoids. The ADF controller PCB does not have a memory area, and the EEPROM of the reader controller PCB is used to store such data as service mode settings. It uses 2 motors for picking up and moving originals. As a result, the last original sensor PI8 generates the last original detection signal ENDS; when the last original moves past the original sensor PI9, the sensor generates the original absent signal EMPS to communicate to the host machine that the original being picked up is the last original. When the Start key is pressed, the original size is checked and communicated to the host machine in real time. The original width detection volume operates in conjunction with the slide guide, and the movement of the guide changes the resistance of the volume analog. The ADF controller checks the changes in the resistance through the original size signal VR to identify the length of the original in cross feed. Some paper sizes, however, are located appreciably near each other, possibly stopping the guide at the wrong position. The machine uses the length of feed with reference to the number of clock pulses from the feed motor M1 generated from when the read sensor PI3 goes on until when the sensor goes off. The read sensor I3 generates the last original detection signal ENDS for the ADF controller PCB. The stopper moves up in keeping with the movement of the pickup roller unit.

The separation plate and the separation pad serve to prevent multiple feeding. In stream reading mode, the machine moves the original over the glass of the host machine for scanning. The host machine's scanner is held in position. The stopper moves up in keeping with the movement of the pickup unit; the separation pad and the separation plate are used to prevent multiple feeding that otherwise may occur at time of pickup. All this while, the separation roller drive shaft driven by way of the spring oneway clutch remains at rest at the upper limit of the pickup roller; the separation roller rotates by the friction against paper and by the work of the oneway clutch. As soon as reading ends image leading edge signal going off, the locking solenoid SL1 goes on so that the delivery reversing roller gets locked in place, causing the paper to move to the delivery assembly.
