Since HewlettPackard's acquisition of Compaq, the product has been marketed by HP. The devices use a Windows Mobile interface. In addition to this, there are several Linux distributions that will also operate on some of these devices. Later versions of iPAQs have most of these features integrated into the base device itself, some including GPRS mobiletelephony simcard slot and radio.A substantial number of current and past devices are outsourced from Taiwanese HTC corporation.With the acquisition of Compaq by HewlettPackard, HP discontinued the Jornada line of Microsoft Windows powered Pocket PCs, moving development and marketing of Pocket PCs to the iPAQ line. It had a fourbit grayscale display, running on Pocket PC 2000. The H3100 was succeeded by the similarlydesigned H3600. Changes included a colour display and a chrome coloured directional pad compared to the monochrome display and gunmetal grey dpad of its predecessor. The H3600 was succeeded by the H3800 and H3900, which retained the same form factor, but had a different button layout.They were sold preinstalled with the Windows Mobile for Pocket PC 2003 Operating System.<http://norrlanet.se/userfiles/casio-bp-100-manual-pdf.xml>

The h63xx series of iPAQs running the Phone Edition of Windows Mobile 2003, the hx47xx series and the rz17xx series, both running the Second Edition of Windows Mobile 2003 were introduced in August 2004. These devices were aimed at consumers, rather than the traditional corporate audience. Emphasis was placed on media features, like NEVO TV Remote and Mobile Media. They ran on Windows Mobile 2003SE. It was replaced a year later by the hw6900 series, running on Windows Mobile 5. Both series of iPAQs work on the Windows Mobile 5 Operating System WM5, as do the hx2000 and hw6900 series. The first HP Windows Mobile 6 device, the iPAQ 500 Series Voice Messenger, with the Windows Mobile 6 Standard Operating System WM6, and numeric pad, was released in the same year. The models announced were the 100 Series Classic Handheld, the 200 Series Enterprise Handheld, the 300 Series Travel Companion, the 600 Series Business Navigator and the 900 Series Business Messenger. The 100 and 200 Series are regular touchscreen PDAs without phone functionality running WM6. The 300 Series Travel Companion is not a PDA; marketed as a Personal Navigation Device, it is a handheld GPS unit operating on the Windows CE 5.0 core Operating System with a custom user interface. The 600 and 900 series are phones with integrated GPS and 3G capabilities, running the WM6 Professional. The 600 series possesses a numeric pad and the 900 series features a full QWERTY keyboard. HP continues to advertise the 111 series and the Glisten on its website, however. As such, the status and fate of the iPAQ line is unclear. It stopped being actively maintained in 2007. Support for handwriting recognition, onscreen keyboard, bluetooth, IrDA and addon hardware such as keyboards are standard in both environments. Upgrades could be purchased from HP. Windows Mobile 2003 could be installed on

the H3950, H3970, h5450 and possibly other models of the H3xxx series with sufficient ROM capacity. These include Windows Mobile 6.0,

Voltage 3.7V Pay attention To calculate the overall star rating and percentage breakdown by star, we don't use a simple average. Instead, our system considers things like how recent a review is and if the reviewer bought the item on Amazon. It also analyzes reviews to verify trustworthiness. Please try again later. S. Grimes 5.0 out of 5 stars Obviously the battery had long since died a slow and lonesome death not being used or charged for that long. I have a friend that was talking about getting a PDA and thought, hey, they can have my old one. I was so glad I hadn't just chucked it. When the unit did not fire up or hold a charge I thought, oh well, I guess I can chuck it now. Tried a quick search on Amazon and found this product. Piece of cake to install and the Ipaq is up and running like new. good stuff and worth the money over buying a whole new PDA. Installation was straightforward, took maybe 5 minutes. Battery life is excellent. I'd definitely recommend this. Very happy with my purchase. The shipment was fast! I had begun shopping for a new pocketPC, and happened to find this and 2000mAh battery on amazon.com, and decided to take a chance on the 2200mAh. The installation is easy and straightforward. I have been using this new battery inside my old Ipaq for about a week now, and the new battery can last a whole week with normal use and moderate mp3 plays. Great battery! It brought my old Ipaq back to life. I highly recommend it!! This one is FAR superior to the last.

If I find myself in need of another one, this is where I will go! Learn more opens in a new window or tab This amount is subject to change until you make payment. The device is the main competition to the Palm, but provides more multimedia capabilities using a Microsoft Windows interface. In addition to this, there are several Linux distributions that will also operate on some of these devices. Current iPAQs have most of these features integrated into the

base device itself. The series is the HP iPAQ 500 Series Voice Messenger. The 3635 was accompanied by a CF expansion sleeve that was sold separately with the other 2. Some of these sleeves contain extra batteries to extend the iPAQs battery life under the strain of added devices. The frequency column using 3.579545 MHz crystal is for reference only, the iPAQ H3600 does not use this crystal in its design. The iPAQ H3600 uses bank 0 only. Stack 0xc0317f44 to 0xc0318000 Backtrace. Code e1d330b0 e5922228 e0811303 e20110ff e5c21000 As far as i know there is no 2.6 kernel used at this time that means no support, there is only 2.4 cause most of developers are working on the openmoko project which is a full open source mobile phone. There are several varieties of controllers, but all share the same basic functionality. The Socket Services software layer takes care of all the details of how to program the host controller. All supported controllers support at least four independent memory windows and two IO windows per socket. Some controllers differ in their alignment rules for memory windows, but all controllers will support windows whose size is at least 4K and also a power of two, and where the base address is a multiple of the window size. Each window can be programmed to point to either attribute or common memory. Effectively, the base addresses of the window in the host and card address spaces are always equal. IO windows also have no alignment or size restrictions; an IO window can start and end on any byte boundary in the 64K IO address space. All controllers support steering card IO interrupts to essentially any free interrupt line. Because steering happens in the controller, the card itself is unaware of which interrupt it uses. These interrupts are distinct from the IO interrupts generated by an IO card, and use a separate interrupt line. I suspect that what you. The disk can Kingston PCMCIA hard drive. It looks like the boot This line from the mkdosfs man page Thanks again for your help. Is this still the case Mounting vfat on partition 00000000. Mounting vfat on partition 00000000. Invalid long filename entry filename too long Looking for a small and lightweight keyboard for your iPAQ. This micro keyboard fits seamlessly and securely to your iPAQ Pocket PC with or without an Expansion Pack attached. Its ergonomic design and standard layout let you conveniently type quickly and comfortably anywhere. Its API is fully compatible with the one of the X11 version. If you want to use an Fino a oggi l'unica scelta praticabile era, forse, Java, che con le sue librerie assicurava una qualche forma di portabilita, purtroppo non totale per applicativi che fanno un uso avanzato di grafica, multimedia e funzionalita del "device". Fino a oggi, dicevo. Basta guardare un video per

capire cosa sia possibile fare già a partire da adesso. The Win32 API implementation is known as Microwindows, and the Xliblike API implementation is known as NanoX. Microwindows does not require any operating system or other graphics system support, as it writes directly to the display hardware, although it runs well on Linux framebuffer systems. Microwindows is designed to be portable, and can run in a wide variety of hardware and software environments. One of the more interesting targets is the emerging market of portable handheld and pocket PCs running Linux, also known as LinuxCE. In addition, it has been ported to 16bit Linux ELKS, and realmode MSDOS. Microwindows screen drivers for 1, 2, 4, 8, 16 and 32 bits per pixel have been written, as well as a VGA 16 color 4 planes driver. Microwindows has been ported to a number of Handheld and Pocket PCs, as well. The Microwindows graphics engine is capable of running on any system that supports readpixel, writepixel, drawhorzline and drawvertline, and setpalette. Blitting support is optional, but if implemented allows enhanced functionality. All bitmap, font, cursor and color support is implemented on top of these routines. Support for 8, 15, 16 and 32 bit truecolor systems as well as 1, 2, 4 and 8bpp palletized systems is implemented.

This driver emulates all of Microwindows truecolor and palette modes so that an application can be previewed using the target systems display characteristics directly on the desktop display, regardless of the desktop display characteristics. It has been ported to the Intel 16 and 32 bit cpus, as well as MIPS R4000 NEC Vr41xx and ARM chips found on popular handheld and pocket PCs. On 32bit systems, support includes proportional fonts and applications are typically less than 100k. At the mid level, a portable graphics engine is implemented, providing support for line draws, area fills, polygons, clipping and color models. At the upper level, various APIs are implemented providing access to the graphics applications programmer. Currently, Microwindows supports the Win32 and NanoX APIs. These APIs provide close compatibility with the Win32 and X Window systems, allowing programs to be ported from other systems easily. Could not initialize graphics driver fb. Could not get VT mode overlapped and child windows are supported, with complete window and client area clipping. Proportional and fixed fonts are supported, along with utilities for converting fonts or bitmap files. Optimized painting algorithms are used to allow maximum response while the user is moving windows on the screen. Off screen drawing and bitblit routines are implemented for flickerfree drawing and animation. Polygon draws, fills and arbitrary region clipping are also supported. The mouse type to be used with NanoX is set in the config file and the specified mouse driver is then compiled in. Touch panel drivers use the mouse interface with a specific driver. Following are the currently supported mouse types settable in the config file. Currently, most development time is geared towards producing a stable, and full featured Linux distribution for the Compaq iPAQ h3600 series of handheld computers, as well as apps to run on top of the distribution. Familiar v0.5.3 was released July 11, 2002. Familiar v0.8.

2 was released April 13, 2005. Familiar v0.8.4 was released August 20, 2006. It can be mounted over NFS so no changes to a current configuration are needed. It includes a native gcc environment for ARM, the zgcc3.3.1 cross compiler for the main PC with distcc configured so that the main PC does the actual compiling, and X11 for testing applications. The first public release was version 0.1.1, dated January 6, 2004. Version 0.2.2 was released February 2, 2004.
