Wifi direct connection android

How to wifi direct android. How to use wifi direct android. What is wifi direct share android.

Wi-Fi Direct (also known as Peer-to-peer or P2P) allows your application to find and interact quickly with close devices, in a range beyond Bluetooth's abilities. The Peer-to-Peer Wi-Fi (P2P) APIs allow applications to connect to nearby devices without having to connect to a network or a hotspot. If your app has been designed to be part of a safe network, close to range, Wi-Fi Direct is a more suitable option than the traditional Wi-Fi ad-hoc network for the following reasons: Wi-Fi Direct supports WPA2 encryption. (Some AD-HOC networks only support WEP encryption) Devices can transmit the services they provide, which help other devices discover the same more easily. In determining which device should be the network owner for the network, Wi-Fi Direct examines the power management features, UI and services of each device and uses this information to choose the device that can handle server responsibilities in more effective way. Android does not support the Wi-Fi ad-hoc mode. This lesson shows you how to find and connect to the neighboring devices that use Wi-Fi P2P. Set the application permissions to use wi-fi p2p, add the access_fine_location, connection_change_wifi_state, access_wifi_state and internet permissions for your manifest. Wi-Fi P2P does not require an internet connection, but uses standard Java sockets, which requires Internet authorization. So you need the following permissions to use wi-fi p2p:
